

Seat Management V1.

How the Media Shuttle Portal & Suite Drive seat system runs —
onboarding, reminders, extensions and clean-ups — across Notion,
Slack and email.

[System Guide](#)[Version 1.0 · 2026](#)

One database runs the whole life of a seat.

When a producer needs a freelancer or client on **Media Shuttle (Portal)** or the **Suite Drive**, this system onboards them, watches the clock, and keeps seats from quietly piling up. Notion is the single source of truth; the automation does the chasing so the team doesn't have to.

The three players

PRODUCER requests the seat, gets the 24-hour reminder in their job channel, and decides whether to extend.

I/O TEAM adds the seat in Media Shuttle / Suite, then approves extensions or removes seats in Notion.

SEAT HOLDER (freelancer / client) just receives clean branded emails — onboarding, extended, or removed.

The promise

Nobody has to remember a seat is expiring. The system raises its hand **24 hours before**, gives one-click options, and only nudges I/O when something actually needs doing.

Seats can be **extended forever** — one approval per cycle — or cleanly retired with the holder emailed automatically.

THE LIFECYCLE AT A GLANCE

1

Onboard. Producer's request creates the seat; the holder gets a branded access email. I/O ticks

`Seat Added`.

2

24h reminder. The day before expiry, the job channel gets an **Extend seat** button; #ns-io gets a heads-up summary.

3

Extend (optional). Producer picks a new date in Slack → it writes to Notion and pings I/O to action it.

4

Approve / Remove. I/O ticks `Extend Approved` or `Seat Removed` → the holder is emailed + the job channel gets a confirmation.

5

Day-of & overdue. A "remove today" digest hits #ns-io; anything still lingering after 3 days gets an escalation.

Four tools, one loop.

Notion holds the truth. Make.com is the engine. Slack is where people act. Gmail tells the seat holder. Everything talks back to Notion.

The loop that matters: every action — a button click, a checkbox — flows through Make and writes its result **back into Notion**. That's why the database is always the truth, and why an approved extension can quietly re-arm the seat for its next cycle.

What producers & I/O see and do.

All messages come from the **NS Seat Management** bot. Producers act in their **job channel**; I/O watches **#ns-io**.

① The 24-hour reminder **PRODUCER**

- 1 The day before a seat expires, the bot posts " **Seat expiring tomorrow**" in the job channel, plus an **Extend seat** button with a date picker. A single summary of all expiring seats also lands in #ns-io.
- 2 To keep the seat: **pick a new date** in the picker, then click **Extend seat**.
- 3 The bot replies in the channel — "**Extension requested — new expiry [date]. I/O notified.**" — and posts an action card in #ns-io with the name, job and date.
- 4 To let it expire: do nothing. The day-of and overdue notices take over (see Notion side).

② Confirmations the channel gets back **AUTOMATIC**

- 1 When I/O **approves** the extension, the job channel gets " **[Name] extended till [date] — thank you!**" and the holder is emailed.
- 2 When I/O **removes** the seat, the job channel gets " **[Name]'s seat has been removed — thanks!**"

Producers never touch Notion — every status they need comes back to the channel they already live in.

③ What I/O watches in #ns-io **I/O**

- 1 **Morning summary** — which seats are expiring tomorrow.
- 2 **Extend requests** — name · job · requested new date, as producers click.
- 3 **"Remove today" digest** — the seats to pull from Media Shuttle / Suite that day.
- 4 **Overdue escalation** — anything still not removed 3+ days after expiry.

The I/O control panel.

Everything I/O does is a checkbox in the **Portal Seat Database**. Three views keep it simple — and the automation owns the rest.

The three views

- **Seats to add** — new requests. Add the seat in Media Shuttle / Suite, then tick ☐ **Seat Added**.
- **Occupied Seats** — live seats, soonest-expiry first. Your day-to-day working view.
- **Removed Seats** — the archive.

Your two actions

Tick ☐ **Extend Approved** once you've extended the seat in Media Shuttle / Suite → holder emailed + channel thanked.

Tick ☐ **Seat Removed** once you've pulled it → holder emailed + channel thanked + it moves to the archive.

Approving an extension — step by step I/O

- 1 A producer's request shows ☐ **Extend Requested** ✓ and an **Extend To** date on the row.
- 2 Action the new expiry in Media Shuttle / Suite as usual.
- 3 Tick ☐ **Extend Approved**. That's it — the holder gets the "extended" email and the job channel gets the thank-you.
- 4 **The seat re-arms automatically:** it keeps the new date but clears the cycle flags, so 24h before that new date the reminder fires again. Repeat forever, one approval per cycle.

Hands off these: the ...Sent checkboxes (Reminder 24h Sent, Extension/Removal Email Sent, Escalation Sent, Deletion Notified) are the automation's memory — they prevent double-sends and reset themselves. Leave them to the system.

Who hears what, and when.

EVENT	JOB CHANNEL	#NS-IO	SEAT-HOLDER EMAIL	TRIGGER
24h reminder	Extend button	summary	—	daily 9am
Extend requested	confirmation	name · job · date	—	Slack click
Extend approved	"extended till X — thank you!"	—	extended email	I/O ticks box
Day-of deletion	—	"remove today" digest	—	daily 9am
Seat removed	"removed — thanks!"	—	removed email	I/O ticks box
+3 overdue	—	escalation nudge	—	daily 9am

Cheat sheet — I/O

New request → add seat → tick Seat Added.

Extend request → extend in MS/Suite → tick Extend Approved.

Time's up → pull seat → tick Seat Removed.

Never tick the ...Sent flags.

Cheat sheet — Producer

Got the reminder? Pick a date → **Extend seat**.

Done with it? Ignore it — it retires itself.

Everything comes back to your job channel.

Two portal types

Portal = Media Shuttle (MS Submit) — file send/receive seat. **Suite** = Suite Drive (Suite Folder) — shared project drive. Each gets its own wording in every email and notice; the system picks the right one automatically from the row.
